

ABSTRACT OF THE DISCLOSURE

In a remote control pan head system, communication data is outputted from an operation unit and is inputted to a system controller via a modem, a general communication line and another modem. The system controller recognizes a data format of the inputted communication data. If the data format differs from the data format for the communication of a pan head, the data format of the communication data is converted into the data format that conforms with the data format for the pan head, and the converted communication data is transmitted to the pan head. Thus, the remote control pan head can be controlled even if data formats of communication data differ between the operation unit and the remote control pan head.
